OZ PARK HOTEL — AWS AMPLIFY CUSTOM DOMAIN GUIDE

Hostinger DNS Configuration Guide for ozpark.sa

Exact step-by-step instructions to delete old Hostinger DNS records and add the new AWS Amplify DNS records.

DOMAIN NAME	DNS PROVIDER	AWS AMPLIFY APP ID	AMPLIFY CLOUDFRONT TARGET
`ozpark.sa`	`Hostinger (hPanel)`	`d2afeob7eeqdyo`	`ds3l8omsbyfjo.cloudfront.net`

STEP 1 Open Your DNS Zone Editor in Hostinger

1. Log in to **Hostinger hPanel** (`hpanel.hostinger.com`).
2. Click **Domains** in the left sidebar, then click on **ozpark.sa**.
3. Click **DNS / Nameservers** in the left menu to open the **DNS records** table.
4. **Important Check:** If you see a toggle called **Hostinger CDN** at the top of the DNS page and it is turned **ON**, switch it **OFF** (disable it). When Hostinger CDN is ON, it locks your `@` and `www` records to `cdn.hstgr.net` .

STEP 2 — DELETE Delete These Existing Conflicting Records in Hostinger

Scroll through your current Hostinger DNS records list for **ozpark.sa** and click the **Trash / Delete icon** next to every existing **A**, **AAAA**, and **CNAME (www)** record listed below:

TYPE	NAME (HOST)	CURRENT VALUE / POINTS TO (IN YOUR HOSTINGER ZONE)	ACTION
A	`@`	`91.108.100.73` *(or any other IPv4 on @)*	DELETE RECORD
A	`@`	`191.101.228.250` *(or any other IPv4 on @)*	DELETE RECORD
AAAA	`@`	`2a02:4780:39:140a:857c:6076:1f31:7486` *(IPv6)*	DELETE RECORD
AAAA	`@`	`2a02:4780:16:5755:a045:c62e:a4e4:8b9` *(IPv6)*	DELETE RECORD
CNAME	`www`	`www.ozpark.sa.cdn.hstgr.net` *(or `ozpark.sa`)*	DELETE RECORD
CAA *(if any)*	`@`	If there is any old CAA record restricting SSL to Let's Encrypt only	DELETE IF PRESENT

What to KEEP (Do NOT Delete): Keep your existing **NS** (Nameserver), **SOA**, **MX** (Email), and **TXT** (SPF/DKIM email verification) records untouched so your `@ozpark.sa` business emails continue working normally.

STEP 3 — ADD Add These 3 New AWS Amplify DNS Records in Hostinger

At the top of the Hostinger DNS Zone Editor under **"Manage DNS records"**, add the following records one by one and click **Add Record**:

RECORD PURPOSE	TYPE	NAME (HOST) TO ENTER IN HOSTINGER	POINTS TO / TARGET (VALUE)	TTL
1. SSL Verification ADD FIRST	**CNAME**	`_edf71cb7bf8a1f8c123c28f8e7b70eb5` *Do NOT include .ozpark.sa at the end!	`_b4856488d25aae5b5b25b292086ec4fd.wzccmgtwzk.acm-validations.aws` (Use the purple copy icon in AWS Amplify; remove the final trailing dot "." if Hostinger rejects it)	`300` (or 14400)
2. Subdomain (www) ADD SECOND	**CNAME**	`www`	`ds3l8omsbyfjo.cloudfront.net`	`300` (or 14400)
3. Root Domain (@) ADD THIRD See Note Below!	**A** (or ALIAS / CNAME)	`@`	**Option A (Always works in Hostinger — Add these A record IPs for `ds3l8omsbyfjo.cloudfront.net`):** • `108.139.74.213` • `108.139.74.74` • `108.139.74.112` • `108.139.74.8` **Option B (If Hostinger allows CNAME on @):** Type: `CNAME` | Name: `@` | Target: `ds3l8omsbyfjo.cloudfront.net`	`300` (or 14400)

CRITICAL HOSTINGER TIP #1 (Why SSL Verification Fails if Entered Wrong):
When you click the copy icon in AWS Amplify for the SSL Hostname, it copies `_edf71cb7bf8a1f8c123c28f8e7b70eb5.ozpark.sa.` — However, Hostinger automatically appends `.ozpark.sa` to whatever you type in the **Name** box! Always delete `.ozpark.sa.` from the **Name** field so the **Name** field contains ONLY: `_edf71cb7bf8a1f8c123c28f8e7b70eb5`

CRITICAL HOSTINGER TIP #2 (Why AWS Amplify Shows "ANAME" for @):
AWS Amplify writes `ANAME` for the root domain `@`, but Hostinger's dropdown does not have an `ANAME` option and usually blocks `CNAME` on `@` when email (`MX`) records exist. Adding the **Type: A** records on `@` pointing to `108.139.74.213` (and `108.139.74.74`, `108.139.74.112`, `108.139.74.8`) points `ozpark.sa` directly to your AWS Amplify CloudFront distribution (`ds3l8omsbyfjo.cloudfront.net`) without any Hostinger error!

STEP 4 — VERIFY

Wait 5–15 Minutes for AWS Amplify SSL & Domain Activation

1. Once you have deleted the old records (Step 2) and added the new records (Step 3) in Hostinger, return to your open **AWS Amplify -> Custom domains** browser tab.
2. AWS Amplify automatically polls Hostinger's DNS every few minutes. Within **5 to 15 minutes**:
   - **SSL configuration** will turn green (✓).
   - **Domain activation** will turn green (**✓ Available**).
3. Both **https://ozpark.sa** and **https://www.ozpark.sa** will be live with automatic HTTPS!
